The fusion proteins of the invention may act as an inhibitor of protease activity. The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic inhibiting protease activity pulmonary disease, cystic fibrosis, ottis media, otitis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteans are useful for treating dermatological diseases activity. The proteans are useful for treating dermatological diseases to viral infection, and for treating protaasis, in inflammatory responses to viral infection, and for treating wounds, sepsis, rheumatoid arthritis, periodontal disease, tumour metastasis and tumour anglogenesis, gastric ulceration, cornel or gastrophy. The paget's disease, glomerullonephritis, scleroderma, malaria, bacterial infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the human secretory is element to the protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TACAAGAAGCCAGAATGTCAATCCGACTGGCAATGTCCAGGTAAGAAGAGATGTTGTCCA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel fusion protein useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, comprises a first protease inhibitor comprising alpha 1-antitrypsin and a second protease inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           45

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                               This invention relates to novel NOVX proteins, and the DNA sequence which encode them, having properties related to stimulation of biochemical or physiological responses in a cell, a tissue, an organ or an organism.

Compounds which modulate the proteins of the invention may have cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, antiarteriosclerotic, nephrotropic, dermatological, antirheumatic, immunosuppressive, anti-HIV, antinflammatory, neuroprotective, corropic, antipportatic, antiparkinsonian, antiathmatic, neuroleptic, antidepressant, antiallergic or gynaecological activities. The DNA sequences of the invention may be useful for gene therapy whilst the protein sequences of the invention may be useful for treating a syndrome corrected that a human disease. The invention may be useful in the manufacture of a medicament for treating a syndrome cassociated with a human disease. The invention may be useful in diagnosing, treating or preventing NOVX-associated disorders, for example cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, chemmatoid arthritis, diabetes, glomeculomephritis, psoriasis, skin disease, asthma, schizophrenia, depression, allergies or fertility disorders. The nucleic acids may further be used as characteristic and pharmacogenomics. The present sequence is the cDNA sequence medicine, and pharmacogenomics. The present sequence is the cDNA sequence which encodes the human NOVX27C protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ProGlyLysCysProValThrTyrGlyGlnCysLeuMetLeuAsnProProAsnPheCys 105

The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intractulularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistent to heat, acid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and extibite a high degree of self assembly forming an active tertiary structure in the absence of blochemical circuminations. (B) recombinant serine protease inhibitors. (Updated on direct manufacture of recombinant serine protease inhibitors. (Updated on C) correct PR field.)

as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. RP1-300I2 is from the library RPCI-1 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 6104. .6223 — formatches 174. .298 of consensus" /note="AluSg/x repeat: matches 174. .298 of consensus" 809. .8022 /note="Charlie2 repeat: matches 3505. .3724 of consensus" 8057. .8416 /note="MERS2C repeat: matches 894. .1278 of consensus"

Submitted (29-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire, CBIO 18A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requestes clonerequest@sanger.ac.uk

On Nov 29, 2000 this sequence version replaced gi:1019630.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Emi; EMBL; Sw.; SWISSPROT; Tr.; TREMBL; Wo.; WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence thrush from an the form part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 human chromosome 20, constructed by the Sanger Centre Chromosome 20 human chromosome 20, constructed by the Sanger Centre Chromosome 20 human chromosome 20 human chromosome 20 human chromosome 20 human chromosome 20 human chromosome 20 ronstructed by the Sanger Centre Chromosome 20 recept for a 100 base overlapping sections only once, except for a 100 base overlapp.

The true right end of clone RPI-172H20 is at 100 in this sequence. The true right end of clone RPI-172H20 is at 100 in this sequence. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HS30012 13near PRI 07-APR-2001 Human DNA sequence from clone RP1-30012 on chromosome 20q12-13.12 Contains ESTs, GSSs and STSs. Contains part of a novel gene and the SIPI gene for secretory leukocyte protease inhibitor
